

Authentication Flaws

✗ Typical Flaws in Authentication

- Permits brute force or other automated attacks
- Permits default, weak, or well-known passwords
- Uses weak or ineffective credential recovery and forgot-password processes (e.g. "knowledge-based answers")
- Uses plain text, encrypted, or weakly hashed passwords
- Has missing or ineffective multi-factor authentication
- Exposes Session IDs in the URL
- Does not rotate Session IDs after successful login
- Does not properly invalidate Session IDs

Risk Rating

Broken Authentication

Exploitability	Prevalence	Detecability	Impact	Risk
● Easy	◆ Common	◆ Average	● Severe	A2
(3	+ 2	+ 2) / 3	* 3	= 7.0

Exercise

2. Log in with MC SafeSearch's user account (★ ★)

Exercise

1. Pick one Security Question and explain how 💪 it is against attacks.
2. What would you recommend to pick as an answer? Assume that the risk of compromise is full takeover of your user account.

Security Question ⚠️ This cannot be changed later!

▼

- Your eldest siblings middle name?
- Mother's maiden name?
- Mother's birth date? (MM/DD/YY)
- Father's birth date? (MM/DD/YY)
- Maternal grandmother's first name?
- Paternal grandmother's first name?
- Name of your favorite pet?
- Last name of dentist when you were a teenager? (Do not include 'Dr.')
- Your ZIP/postal code when you were a teenager?
- Company you first work for as an adult?

Password Strength Controls

- **Enforce minimum password length** of at least 10 characters
- Maximum length should allow 64 characters or more
- **No periodic password resets** as users rely on predictable patterns
- Avoid password complexity rules as *all of them* are predictable
- Ban bad passwords or ones which have appeared in data breaches
 - e.g. [Troy Hunt's 10GB+ list](#) or [Daniel Miesler's various lists](#)
- Allow convenience features on password fields
 - Offer *Show Password while typing* option
 - Allow pasting from clipboard into password fields

Other Authentication Controls

- **Transmit passwords only over TLS**
 - The "login landing page" must be served over TLS as well
- **Prevent Brute-Force Attacks** (e.g. throttling or periodic lockout)
- Require re-authentication for sensitive features
- **Offer optional 2FA / MFA**
 - Consider strong transaction authentication

Enterprise Controls

- Use centralized corporate authentication system (if in place)

Two-Factor Authentication

Two-factor authentication adds a second level of authentication to an account log-in. When you have to enter only your username and one password, that's considered a single-factor authentication. 2FA requires the user to have two out of three types of credentials before being able to access an account. The three types are:

- **Something you know**, such as a personal identification number (PIN), password or a pattern
- **Something you have**, such as an ATM card, phone, or fob
- **Something you are**, such as a biometric like a fingerprint or voice print [¹]
