# **Authorization Flaws**

# **Broken Access Control**

Access control is supposed to prevent that users can act outside of their intended permissions.

### Possible Impact of Broken Access Control

- Access unauthorized functionality and/or data, such as access other users' accounts
- View sensitive files
- Modify other users' data
- Change access rights

#### **Common Attacks**

- Modifying URL, internal application state, or HTML page
- Changing the primary key to another users record
- Elevation of privilege
  - Acting as a user without being logged in
  - Acting as an admin when logged in as a user
- i Obtaining a higher level of access is also referred to as **Vertical** Privilege Escalation while same-level access to another user's data is called **Horizontal** Privilege Escalation.

- Metadata manipulation
  - Replaying or tampering with access control tokens
  - Cookie or hidden field manipulation
- Force browsing to authenticated pages as an anonymous user or to privileged pages as a standard user
- Accessing API with missing access controls for POST, PUT and DELETE

# **Risk Rating**

### **Broken Access Control**

Exploitability	Prevalence	Detecability	Impact	Risk
Average	Common	Average	Severe	A5
( 2	+ 2	+ 2)/3	* 3	= 6.0

## Exercise

Assuming no access control is in place, which privilege escalations are possible by tampering with the following URLs?

- 1. http://logistics-worldwi.de/showShipment?id=40643108
- 2. http://my-universi.ty/api/students/6503/exams/view
- 3. http://document-warehou.se/landingpage?content=index.html

# Prevention

- Access control is only effective if enforced in trusted server-side code
- With the exception of public resources, deny by default
- Implement access control mechanisms once and re-use them throughout the application
- Enforce record ownership
- **Disable web server directory listing** and ensure file metadata and backup files are not present within web roots

- Log access control failures, alert admins when appropriate
- Rate limit API and controller access to minimize the harm from automated attack tooling
- Access tokens should be invalidated on the server after logout
- Developers and QA staff should include functional access control unit and integration tests

# Exercise

- 1. Access the *Admin Section* of the store ( $\uparrow \uparrow \uparrow$ )
- 2. *View* some other user's shopping *Basket* ( $\uparrow \uparrow \uparrow$ )
- 3. Get rid of all submitted *Five-Star Feedback* ( $\uparrow \uparrow \uparrow$ )
- 4. Post some *Forged Feedback* for another user ( $\star$
- 5. It's *Payback Time*: Place an order with a negative total ( $\star$
- 6. Access the Forgotten Developer and/or Sales Backup ( $\star$
