Authentication Flaws

X Typical Flaws in Authentication

- Permits brute force or other automated attacks
- Permits default, weak, or well-known passwords
- Uses weak or ineffective credential recovery and forgot-password processes (e.g. "knowledge-based answers")
- Uses plain text, encrypted, or weakly hashed passwords
- Has missing or ineffective multi-factor authentication
- Exposes Session IDs in the URL
- Does not rotate Session IDs after successful login
- Does not properly invalidate Session IDs

Risk Rating

Broken Authentication

Exploitability	Prevalence	Detecability	Impact	Risk
Easy	Common	Average	Severe	A2
(3	+ 2	+ 2)/3	* 3	= 7.0

Exercise 4.1 (**)

- 1. Watch How To Keep Your Passwords Safe 📺
- 2. Log in with MC SafeSearch's user account (\star
- **⚠** Do **not** use SQL Injection for authentication bypass!

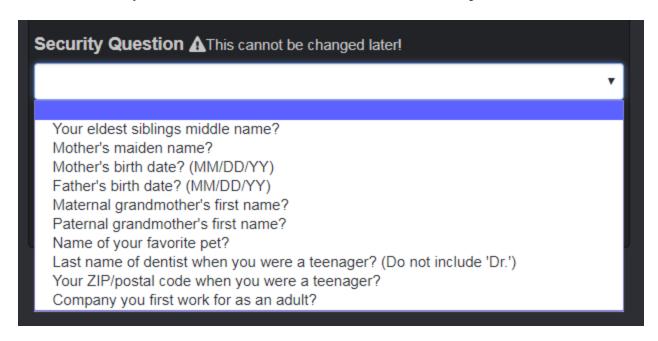

Exercise 4.2 (**)

1. Identify all flaws in the generator of the following session IDs

#	Session ID	#	Session ID
1	h5kek4z9ha1rtrf	7	po953ld7hg2awi9
2	gj75l3k7hb15rtr	8	t6zhj2n5hh27bn0
3	l8l65k45hc1rw7i	9	iu345r53hi2aw34
4	p05jrj53hd1i039	10	o0z43411hj2njkl
5	5urltda1he1bn46	11	9por42o9hk3dfrz
6	j5le97h9hf2yq3h	•••	•••

Exercise 4.3 (*)

- 1. Pick one Security Question and explain how 6 it is against attacks.
- 2. What would you recommend to pick as an answer? Assume that the risk of compromise is full takeover of your user account.

Prevention

User IDs

- Use case insensitive and unique usernames/userids
- If using Email addresses as usernames, ensure RFC 5321 validity
 - i. Check for presence of at least one @ symbol in the address
 - ii. Ensure the local-part is no longer than 64 octets
 - iii. Ensure the domain is no longer than 255 octets
 - iv. Ensure the address is deliverable
- X Do **not** try to invent your own RegEx to validate email addresses!

Password Strength Controls

- Enforce minimum password length of at least 10 characters
- Maximum length should allow 64 characters or more
- No periodic password resets as users rely on predictable patterns
- Avoid password complexity rules as all of them are predictable
- Ban bad passwords or ones which have appeared in data breaches
 - e.g. Troy Hunt's 10GB+ list or Daniel Miesler's various lists
- Allow convenience features on password fields
 - Offer Show Password while typing option
 - Allow pasting from clipboard into password fields

Secure Password Recovery Mechanism

- 1. Gather Identity Data or Security Questions
- 2. Verify Security Questions
- 3. Lock account immediately
- 4. Send a Token Over a Side-Channel
- 5. Allow user to change password in the existing session
- 6. Logging

Secure Password Storage

- Do not limit character set and set long max lengths
- Use cryptographically strong credential-specific salt
- Impose infeasible verification on attacker
 - Aaptive one-way function (Argon2, PBKDF2, bcrypt or scrypt)
 - Keyed functions (e.g. HMAC)
- Design password storage assuming eventual compromise
- Upgrading your existing password hashing solution

Design for Failure

Having detected theft, a credential storage scheme must support continued operation by marking credential data as compromised:

- 1. Invalidate authentication shortcuts (e.g. login only with 2FA)
- 2. Disallow changes to security settings of user accounts
- 3. Load a new, stronger credential protection scheme
- 4. Set tainted / compromised bit until user resets credentials
- 5. Prompt for credential change & conduct out-of-band confirmation
- 6. Convert stored credentials to new scheme as user successfully log in

Other Authentication Controls

- Transmit passwords only over TLS
 - The "login landing page" must be served over TLS as well
- Prevent Brute-Force Attacks (e.g. throttling or periodic lockout)
- Require re-authentication for sensitive features
- Offer optional 2FA / MFA
 - Consider strong transaction authentication

Enterprise Controls

• Use centralized corporate authentication system (if in place)

Two-Factor Authentication

Two-factor authentication adds a second level of authentication to an account log-in. When you have to enter only your username and one password, that's considered a single-factor authentication. 2FA requires the user to have two out of three types of credentials before being able to access an account. The three types are:

- Something you know, such as a personal identification number (PIN), password or a pattern
- Something you have, such as an ATM card, phone, or fob
- Something you are, such as a biometric like a fingerprint or voice print [^1]

2FA Method Comparison

Method	Security	Privacy	Access	Prevalence
SMS	,	•		
Authenticator App	99			
Hardware Key	عرعرعر			

Hardware keys win from a security perspective, they are private and unaffected by a dying or out of range phone. However, only a few services (Google, Dropbox, Facebook, Github and a few others) support the standard so far. Unless you trust your phone provider (and few providers are trustworthy), an authenticator app is the best option.

Password Managers

Password managers are programs, browser plugins or web services that automate management of large number of different credentials, including memorizing and filling-in, generating random passwords on different sites etc. [^2]

KeePass	LastPass ••••	1Password
Open Source (GPLv2)	Proprietary / Freemium	Proprietary
Local installation, optional file or cloud sync	Cloud-based	Local installation with Cloud sync

Web applications should at least not make password managers job more difficult than necessary by observing the following recommendations:

- use standard HTML forms for username and password input with appropriate type attributes,
- do not artificially limit user passwords to a length "reasonable for humans" and allow passwords lengths up to 128 characters,
- do not artificially prevent copy and paste on username and password fields,
- avoid plugin-based login pages (Flash, Silverlight etc) [^1]

Exercise 4.4 (11)

- 1. Log in with the admin's user account ($\uparrow \uparrow \uparrow$)
- 2. Reset Jim's password by answering his secret question (\star
- 3. Log in with Bjoern's Google account (\star

⚠ Do **not** use SQL Injection for authentication bypass! Also, do **not** hack Bjoern's actual Google account!

Exercise 4.5 (11)

- 1. Read https://webauthn.guide/ and play with https://webauthn.io/ to learn how WebAuthn works
- 2. Prepare a convincing "sales pitch" (max. 5min) to convince your classmates and coworkers to use WebAuthn for secure authentication

Exercise 4.6 (optional)

- 1. Install a 2FA app on your phone (e.g. Google Authenticator or Authy)
- 2. Visit https://twofactorauth.org and find out what services you use offer 2FA
- 3. Turn 2FA on wherever possible
- 4. Do not forget to print (= \(\brightarrow !\) the backup codes and keep them safe
- Pro tip: Print hard copies of the originally displayed QR codes for easy setup on any new phone! Just store them very securely!
